

PAVLO MEDVEDSKYI

Senior Quality Assurance Engineer

Kharkiv, Ukraine | Medvedskiypa@gmail.com | t.me/Wisll | linkedin.com/in/pavlo-medvedskiy-74231913b | pavlo-medvedskiy.github.io

SUMMARY

Senior Quality Assurance Engineer with 8+ years of commercial experience in desktop, web, API, database, and real-time systems testing. Strong background in requirements analysis, test design, SQL, API validation, network protocols, Electron applications, Docker, Linux, and cross-platform validation. Experienced in evidence-based defect investigation using logs, data state, client-server behavior, and business logic, with mentoring and knowledge-sharing experience.

CORE TECHNICAL SKILLS

Testing: Functional, Integration, Regression, Smoke, Exploratory, System, Release Validation, Cross-platform Testing
Technical QA: Requirements Analysis, Test Design, API Testing, SQL, Database Validation, Defect Investigation, Client-server Validation, Real-time Log Analysis

Protocol / Integration Exposure: ArduPilot, MAVLink, real-time logs, controlled environment behavior, Electron state/store validation

Platforms: Desktop Applications, Web Applications, Mobile, Electron, Ubuntu, Windows, macOS, Linux, Docker

Tools: Postman, Swagger, Jira, Zephyr, TestRail, Confluence, Fiddler, Chrome DevTools, Sentry, Google Cloud Console, OpenShift, VirtualBox

Automation Exposure: Java, Rest Assured, TestNG, Postman runners

Databases: PostgreSQL, MSSQL, Derby DB, MongoDB, DynamoDB, BigQuery, DBeaver

WORK EXPERIENCE

CODY SOLUTIONS - Senior QA Engineer | Jan 2025 - Present

Multi-project CODY experience across a confidential NDA MilTech desktop platform, mobile/API products, and web/API platforms.

- Built and formalized QA processes from scratch for the NDA MilTech desktop platform, including test plan, QA documentation, defect lifecycle rules, DoR/DoD, and testing entry/exit criteria.
- Introduced structured test case design with clear preconditions, steps, expected results, and requirement traceability; created and currently maintain a 1,209-case TestRail suite mapped to requirements.
- Created Notion-based test case templates and supported migration/import into TestRail, improving test management, coverage visibility, and project-wide QA consistency.
- Standardized defect reporting with actionable summaries, reproduction steps, logs, videos, environment details, actual/expected results, and technical context for developers.
- Worked in a QA/BA hybrid capacity for part of the project, clarifying and documenting requirements before validating implementation.
- Validate a technically complex MilTech Electron desktop application under NDA, covering real-time workflows, integrations, logs, Electron state/store behavior, and cross-platform behavior across Ubuntu, Windows, and macOS.
- Covered three CODY projects - Blai, JMES World, and SupaBox - across mobile, web, API, and integration-heavy workflows, and initiated automation readiness by defining QA expectations and coverage structure.

1648 FACTORY - Senior QA Engineer | 2024

Fintech web application for cryptocurrency trading.

- Performed manual, API, and database testing across multiple environments, including PostgreSQL validation.
- Created and executed automated Postman collections and runners for API regression coverage.
- Validated MetaMask integration, transaction flows, and key web application scenarios.
- Executed smoke and regression testing for web builds; maintained test cases and QA documentation.
- Collaborated with developers and product owners to clarify requirements and support Scrum delivery.

RAILSWARE - QA Engineer | 2022 - 2023

Coupler.io - SaaS data synchronization platform.

- Validated data synchronization workflows, API integrations, and database behavior for scheduled data transfers.
- Tested integrations with Facebook Ads, LinkedIn Ads, Google Ads, Shopify, WooCommerce, and other external services.
- Performed API, database, regression, smoke, responsive, and mobile testing for weekly releases.
- Analyzed production and staging issues using Google Cloud Console, Sentry, logs, and product support context.
- Maintained test plans, checklists, documentation, and cross-functional communication with product and engineering teams.

WORK EXPERIENCE CONTINUED

SOFTSERVE - QA Engineer | 2019 - 2022

Service delivery and monitoring solutions across VoIP, SIP, and MPLS network environments.

- Analyzed functional requirements and created QA strategy, test cases, regression suites, and smoke coverage.
- Performed web, API, installation, and compatibility testing on Windows and Unix/CentOS environments.
- Validated backend data integrity with PostgreSQL and tested API behavior using Postman and Fiddler.
- Investigated defects through application/server logs, OpenShift environments, Java applications, and deployment context.
- Worked with VirtualBox, Chocolatey, Google Cloud, OpenShift, and distributed client-server environments.
- Mentored junior QA engineers, reviewed test cases, supported onboarding, and participated in QA appraisals.

EPAM SYSTEMS - QA Engineer | 2018 - 2019

EPAM Cloud - multi-cloud orchestrator for AWS, GCP, and Azure.

- Performed manual functional, UI, database, CLI, and mobile testing for cloud management workflows.
- Created test cases, documented defects and test results in Jira, and supported Agile QA activities.
- Validated data behavior in MongoDB and DynamoDB and tested cloud-provider related scenarios.
- Collaborated with developers and QA team members during daily standups, reviews, and regression cycles.

SELECTED PROJECT EXPOSURE

CODY Multi-project Exposure

- Confidential MilTech desktop QA
- ArduPilot / MAVLink context
- Real-time logs and integrations
- Electron state/store validation
- Monolith-to-microservices validation
- Blai / JMES World / SupaBox QA

SaaS / Fintech / Data Platforms

- Web, mobile, API, and database testing
- External API integrations and ETL flows
- Crypto transaction and wallet-related workflows
- Regression, smoke, exploratory, and support-driven testing
- Requirements analysis and documentation

PROFESSIONAL FOCUS

- Technically challenging products where quality depends on understanding system behavior, integrations, and data flow.
- Strong preference for evidence-based defect investigation using logs, API responses, database state, and reproducible steps.
- Able to work independently across the full SDLC while collaborating closely with product, development, and support teams.
